

Services: Web Systems

Last Updated Wednesday, 04 June 2008

Practical Control has experience of web based system development for business operations, monitoring, and control of equipment. We have direct experience of systems that are used in the road transport industry across the UK, website development for assisted living monitoring, equipment configuration and healthcare patient systems.

We have developed sites that are used by volume users or connected to many equipment devices that are being monitored in the field, and where requested provided hosting solutions.

Being experts in embedded software and systems means that we can provide solutions to controlling embedded systems via the web.

The development team have particular strengths in the following:-

User centric/context design

How the software is used and how it fulfils the needs of each participant and how people interact with it.

Slick user interfaces and presentation

Products can be differentiated by placing thought into the presentation, graphical look and feel.

Java based developements

Our choice of language is Java, and this allows us to guarantee you that software is well tested, well structured and mature.

It also allows easy cross platform compatibility on Windows, Linux, and Macintosh.

Linux web-servers

Practical Control are adept at deploying Linux, Apache, Tomcat and MySQL.
